# Turing Completeness

- ▶ **Def:** A model of computation is **Turing complete** if it is equivalent to the Turing machine model

# Turing Completeness

- ▶ **Def:** A model of computation is **Turing complete** if it is equivalent to the Turing machine model
- ▶ We need to show that a language can be recognized by a Turing machine if and only if it can be recognized by a machine from the other model

# Turing Completeness

- ▶ **Def:** A model of computation is **Turing complete** if it is equivalent to the Turing machine model
- ▶ We need to show that a language can be recognized by a Turing machine if and only if it can be recognized by a machine from the other model
- ▶ This involves two directions:

# Turing Completeness

- ▶ **Def:** A model of computation is **Turing complete** if it is equivalent to the Turing machine model
- ▶ We need to show that a language can be recognized by a Turing machine if and only if it can be recognized by a machine from the other model
- ▶ This involves two directions:
  1. Show that every language that can be recognized by a Turing machine can be recognized by a machine from the other model

# Turing Completeness

- ▶ **Def:** A model of computation is **Turing complete** if it is equivalent to the Turing machine model
- ▶ We need to show that a language can be recognized by a Turing machine if and only if it can be recognized by a machine from the other model
- ▶ This involves two directions:
  1. Show that every language that can be recognized by a Turing machine can be recognized by a machine from the other model
  2. Show that every language that can be recognized by a machine from the other model can be recognized a Turing machine

# Stationary Turing Machine

# Stationary Turing Machine

- ▶ **Def: A stationary Turing machine (stationary TM)** is a like a normal Turing machine, but the machine has the option to stay in place after reading a character.

# Stationary Turing Machine

- ▶ **Def:** A **stationary Turing machine (stationary TM)** is a like a normal Turing machine, but the machine has the option to stay in place after reading a character.
- ▶ The transition function is
$$\delta : Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R, S\}$$

# Stationary Turing Machine

- ▶ Let's prove that stationary Turing machines are equivalent to Turing machine.

# Stationary Turing Machine

- ▶ Let's prove that stationary Turing machines are equivalent to Turing machine.
  - ▶ That is,  $L$  can be recognized by a Turing machine if and only if  $L$  is recognized by a stationary TM

# Stationary Turing Machine

- ▶ Let's prove that stationary Turing machines are equivalent to Turing machine.
  - ▶ That is,  $L$  can be recognized by a Turing machine if and only if  $L$  is recognized by a stationary TM
- ▶ There are **two** directions to this proof

# Stationary Turing Machine

- ▶ Let's prove that stationary Turing machines are equivalent to Turing machine.
  - ▶ That is,  $L$  can be recognized by a Turing machine if and only if  $L$  is recognized by a stationary TM
- ▶ There are **two** directions to this proof
  1. If  $L$  is recognized by a normal TM, it can be recognized by a stationary TM

# Stationary Turing Machine

- ▶ Let's prove that stationary Turing machines are equivalent to Turing machine.
  - ▶ That is,  $L$  can be recognized by a Turing machine if and only if  $L$  is recognized by a stationary TM
- ▶ There are **two** directions to this proof
  1. If  $L$  is recognized by a normal TM, it can be recognized by a stationary TM
  2. If  $L$  is recognized by a stationary TM, it can be recognized by a TM

# Stationary Turing Machine

( $\Rightarrow$ ) If  $L$  is recognized by a normal TM, it can be recognized by a stationary TM

# Stationary Turing Machine

( $\Rightarrow$ ) If  $L$  is recognized by a normal TM, it can be recognized by a stationary TM

- ▶ Let  $M$  be the TM that recognizes  $L$

# Stationary Turing Machine

( $\Rightarrow$ ) If  $L$  is recognized by a normal TM, it can be recognized by a stationary TM

- ▶ Let  $M$  be the TM that recognizes  $L$
- ▶  $\underline{M}$  **is** a stationary TM that simply chooses not to stay in place

# Stationary Turing Machine

( $\Rightarrow$ ) If  $L$  is recognized by a normal TM, it can be recognized by a stationary TM

- ▶ Let  $M$  be the TM that recognizes  $L$
- ▶  $M$  **is** a stationary TM that simply chooses not to stay in place
- ▶ Thus,  $L$  can be recognized by a stationary TM

# Stationary Turing Machine

( $\Leftarrow$ ) If  $L$  is recognized by a stationary TM, it can be recognized by a normal TM

# Stationary Turing Machine

( $\Leftarrow$ ) If  $L$  is recognized by a stationary TM, it can be recognized by a normal TM

- ▶ Let  $M$  be the stationary TM that recognizes  $L$

# Stationary Turing Machine

( $\Leftarrow$ ) If  $L$  is recognized by a stationary TM, it can be recognized by a normal TM

- ▶ Let  $M$  be the stationary TM that recognizes  $L$
- ▶ **Technique:** create a normal TM that simulates  $M$

# Stationary Turing Machine

( $\Leftarrow$ ) If  $L$  is recognized by a stationary TM, it can be recognized by a normal TM

- ▶ Let  $M$  be the stationary TM that recognizes  $L$
- ▶ **Technique:** create a normal TM that simulates  $M$
- ▶ Create a machine  $M_2$  behaves as  $M$  would, with one exception

# Stationary Turing Machine

( $\Leftarrow$ ) If  $L$  is recognized by a stationary TM, it can be recognized by a normal TM

- ▶ Let  $M$  be the stationary TM that recognizes  $L$
- ▶ **Technique:** create a normal TM that simulates  $M$
- ▶ Create a machine  $M_2$  behaves as  $M$  would, with one exception
- ▶ If  $M$  is supposed to stay in place,  $M_2$  will move left and then move right before proceeding

# 2-hop Turing Machine

## 2-hop Turing Machine

- ▶ **Def:** A **2-hop Turing Machine** is a like a normal Turing machine, but it can move up to 2 spaces left or right.

## 2-hop Turing Machine

- ▶ **Def:** A **2-hop Turing Machine** is a like a normal Turing machine, but it can move up to 2 spaces left or right.
  - ▶ The transition function is
$$\delta : Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R, LL, RR\}$$

## 2-hop Turing Machine

- ▶ **Def:** A **2-hop Turing Machine** is a like a normal Turing machine, but it can move up to 2 spaces left or right.
  - ▶ The transition function is
$$\delta : Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R, LL, RR\}$$
- ▶ Let's prove that 2-hop Turing machines equivalent to Turing machines.

# 2-hop Turing Machine

- ▶ **Def:** A **2-hop Turing Machine** is a like a normal Turing machine, but it can move up to 2 spaces left or right.
  - ▶ The transition function is
$$\delta : Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R, LL, RR\}$$
- ▶ Let's prove that 2-hop Turing machines equivalent to Turing machines.
  - ▶ What are the two directions?

## 2-hop Turing Machine

( $\Rightarrow$ ) If  $L$  is recognized by a normal TM, it can be recognized by a 2-hop TM

## 2-hop Turing Machine

( $\Rightarrow$ ) If  $L$  is recognized by a normal TM, it can be recognized by a 2-hop TM

- ▶ Let  $M$  be the TM that recognizes  $L$

## 2-hop Turing Machine

( $\Rightarrow$ ) If  $L$  is recognized by a normal TM, it can be recognized by a 2-hop TM

- ▶ Let  $M$  be the TM that recognizes  $L$
- ▶  $M$  **is** a 2-hop TM that chooses to only move one square at a time.

# 2-hop Turing Machine

( $\Leftarrow$ ) If  $L$  is recognized by a 2-hop TM, it can be recognized by a normal TM

## 2-hop Turing Machine

( $\Leftarrow$ ) If  $L$  is recognized by a 2-hop TM, it can be recognized by a normal TM

- ▶ Let  $M$  be the 2-hop TM that recognizes  $L$

## 2-hop Turing Machine

( $\Leftarrow$ ) If  $L$  is recognized by a 2-hop TM, it can be recognized by a normal TM

- ▶ Let  $M$  be the 2-hop TM that recognizes  $L$
- ▶ We will design a normal TM  $M_2$  to simulate  $M$

## 2-hop Turing Machine

( $\Leftarrow$ ) If  $L$  is recognized by a 2-hop TM, it can be recognized by a normal TM

- ▶ Let  $M$  be the 2-hop TM that recognizes  $L$
- ▶ We will design a normal TM  $M_2$  to simulate  $M$
- ▶  $M_2$  operates as  $M$  would. If  $M$  tries to hop two spaces right or left,  $M_2$  will perform the two hops over two consecutive steps

# 2-tape Turing Machine

# 2-tape Turing Machine

- ▶ **Def:** A **2-tape Turing machine** is a TM with 2 different tapes

# 2-tape Turing Machine

- ▶ **Def:** A **2-tape Turing machine** is a TM with 2 different tapes
  - ▶ Each tape has a separate tape head

# 2-tape Turing Machine

- ▶ **Def:** A **2-tape Turing machine** is a TM with 2 different tapes
  - ▶ Each tape has a separate tape head
  - ▶ The two tape heads share a common state, but they move independently

# 2-tape Turing Machine

# 2-tape Turing Machine

- ▶ **Def:** A **2-tape Turing machine** is a TM with 2 different tapes
  - ▶ Each tape has a separate tape head
  - ▶ The two tape heads share a common state, but they move independently
  - ▶ The transition function is
$$\delta : Q \times \Gamma^2 \rightarrow Q \times \Gamma^2 \times \{L, R\}^2$$
